Eight-week Libraries’ Course Builds Undergraduate Students’ Research Skills

Eight-week course designed to help students learn effective ways of finding, evaluating and using information systems (GIS).

While attending graduate school she worked with the Kansas Department of Natural Resources, helping create a GIS that tracks natural resources such as plant and animal species. It was here she became familiar with and discovered how much she enjoyed helping people.

While at KU, Houser’s responsibilities vary depending on the time of year. She is involved in helping users with their GIS data, and work with GIS data, whether it’s for mapping elections and voting data in relation to points on a map. It is the problem solving and challenge of GIS that Houser loves about her job the most.
